# PREDICTING FUTURE PRODUCT PRICES USING FACEBOOK PROPHET

Professor Ahmed

Submitted by Donald Ghazi

TASK #1: PROJECT OVERVIEW

- In this project, we will predict the future prices of avocados using Facebook Prophet.
- Prophet is an open source tool used for time series forecasting.
- The expected outcome will look like this image below:

TASK #2: IMPORT LIBRARIES AND DATASET

- You must install fbprophet package as follows: pip install fbprophet
- If you encounter an error, try: conda install -c conda-forge fbprophet

```
In [1]:  # import libraries
         import pandas as pd # Import Pandas for data manipulation using dataf
         rames
         import numpy as np # Import Numpy for data statistical analysis
         import matplotlib.pyplot as plt # Import matplotlib for data visualis
         ation
         import random
         import seaborn as sns
         from fbprophet import Prophet
```

Importing plotly failed. Interactive plots will not work.

```
In [2]:  # dataframes creation for both training and testing datasets
         avocado_df = pd.read_csv('avocado.csv')
```

- Date: The date of the observation
- AveragePrice: the average price of a single avocado
- type: conventional or organic
- year: the year
- Region: the city or region of the observation
- Total Volume: Total number of avocados sold
- 4046: Total number of avocados with PLU 4046 sold
- 4225: Total number of avocados with PLU 4225 sold
- 4770: Total number of avocados with PLU 4770 sold

```
In [3]:  # Let's view the head of the training dataset
         avocado_df.head()
```

TASK 5: UNDERSTAND INTUITION BEHIND FACEBOOK PROPHET

FACEBOOK PROPHET

- Prophet is open source software released by Facebook's Core Data Science team.
- Prophet is a procedure for forecasting time series data based on an additive model where non-linear trends are fit with yearly, weekly, and daily seasonality, plus holiday effects.
- Prophet works best with time series that have strong seasonal effects and several seasons of historical data.
- For more information, please check this out:
  - https://research.fb.com/prophet-forecasting-at-scale/
  - https://facebook.github.io/prophet/docs/quick_start.html#python-api

FACEBOOK PROPHET

- Prophet implements an additive regression model with four elements:

  - A piecewise linear, Prophet automatically picks up change points in the data and identifies any change in trends.
  - A yearly seasonal component modeled using Fourier series.
  - A weekly seasonal component.
  - A holiday list that can be manually provided.

- Additive Regression model takes the form:
$$Y = \beta_0 + \sum_{j=1}^{p} f_j(X_j) + \epsilon$$

- The functions $f_j(x_j)$ are unknown smoothing functions fit from the data

- Reference: https://research.fb.com/prophet-forecasting-at-scale/

FACEBOOK PROPHET FEATURES

ACCURATE AND FAST
- Facebook teams uses Prophet for accurate forecasting and planning.
- Prophet can generate results in seconds.

AUTOMATIC
- No need to perform data preprocessing.
- Prophet works with missing data with several outliers.

DOMAIN KNOWLEDGE INTEGRATION
- Users can tweak forecast by manually adding domain specific knowledge.

TASK 6: DEVELOP MODEL AND MAKE PREDICTIONS - PART A

In [21]:
```python
m = Prophet()
m.fit(avocado_prophet_df)
```

```
